***Claim Rejections - 35 USC § 112***

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 21 recites the limitation "said second parallel bus" in line 2. There is insufficient antecedent basis for this limitation in claims 21 or 11.

***Claim Rejections - 35 USC § 103***

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-33 are rejected under 35 U.S.C. 103(a) as being unpatentable over Conway (US 6,425,033 or 6,418,504) and further in view of Baker (US 6,434,649).

As shown in Figs. 1, 2-3, Conway discloses the same method and apparatus which comprises two parallel PCI buses and a serial bus such as the 1394 firewire bus, and the necessary bridges (Figs. 1, 2-3 and respective disclosure), as specified

Art Unit: 2661

in claims 1-33. However, Conway fails to particularly call for the details of buffers and the address and data phases or byte enable packets/commands. Therefore, Conway fails to disclose using predetermined values for the byte enable values/packets.

Baker teaches various buffers (Fig. 7, or 10 and cols. 17, line 46-col. 20; col. 29-36) such as FIFOs (e.g., 716, Fig. 7; col. 7, lines 6-11; 764; col. 29, lines 20-63), pipeline control logic (Fig. 7 and respective disclosure; Fig. 8; col. 20, line 64-col. 22, line 6), and that it is well known to predetermine or predict the size of the data bursts that are about to be transmitted (cols. 13-16, especially Table 1), and therefore, Baker does teach the claimed limitations such as a first phase (address or request phase) which uses predetermined byte enable values (Table 1).

It would have been obvious to use the well known byte enable sizes so that the data can be sent more quickly.

***Claim Rejections - 35 USC § 103***

3. Claims 11-13, 16-20, 22-32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Welker (US 6,076,139) or Tripathi (US 6,161,157) in view of Baker (US 6,434,649).

As shown in e.g., Fig. 1, Welker discloses the parallel/PCI to serial/1394 conversions.

**6,076,139**

**FIG. 1**

As shown in Fig. 5 (see below) Tripathi discloses the parallel/PCI to serial/1394 conversions.

**6,161,157**

**FIG. 5**

However, Tripathi and/or Welker fail to disclose using predetermined values for the byte enable values/packets.

Baker teaches various buffers (Fig. 7, or 10 and cols. 17, line 46-col. 20; col. 29-36) such as FIFOs (e.g., 716, Fig. 7; col. 7, lines 6-11; 764; col. 29, lines 20-63), pipeline control logic (Fig. 7 and respective disclosure; Fig. 8; col. 20, line 64-col. 22, line 6), and that it is well known to predetermine or predict the size of the data bursts that are about to be transmitted (cols. 13-16, especially Table 1), and therefore, Baker does teach the claimed limitations such as a first phase (address or request phase) which uses predetermined byte enable values (Table 1).

Art Unit: 2661

It would have been obvious to use the well known byte enable sizes so that the data can be sent more quickly.
